4	Matrix Inverses	5

- 1. Which of the following sets forms a vector space?
 - a) $\{\mathbf{x} \mid x_1, x_2 \in \mathbb{R} \text{ and } \alpha_1 x_1 + \alpha_2 x_2 = 0\}$, where $\alpha_1, \alpha_2 \in \mathbb{R}$ are fixed constants.
 - b) $\{x | x \in \mathbb{R}^n \text{ and } \mathbf{a}^\top x = \mathbf{b}\}$, where $\mathbf{a} \in \mathbb{R}^n$ and $\mathbf{b} \in \mathbb{R}$ are fixed constants.
 - c) $\{x \mid x \in \mathbb{R}^n \text{ and } x^\top x = 1\}$.
 - d) $\{(x[0], x[1], x[2], \dots x[N-1]) \mid x[i] \in \mathbb{R}, 0 \le i < N\}.$

(The set of all real-valued time-domain signals of length N. x[i] is the value of the signal at time instant i.)

2. Consider the vector space of polynomials of order n or less.

$$\mathcal{P} = \left\{ \sum_{k=0}^{n} a_k x^k \, \middle| \, a_k \in \mathbb{R} \right\}, \text{ where, } x \in [0, 1]$$

Show that polynomails of order strictly lower than n form subspaces of \mathcal{P} .

3. Is the following function a valid norm of the vector space \mathcal{P} ?

$$\|\mathbf{p}\left(\mathbf{x}\right)\| = \sqrt{\sum_{k=0}^{n} \alpha_{k}^{2}}, \ \mathbf{p} = \sum_{k=0}^{n} \alpha_{k} \mathbf{x}^{k} \in \mathcal{P}$$

4. Consider the following function, which is often called the *zero-norm* of a vector $\mathbf{x} \in \mathbb{R}^n$.

$$\|\mathbf{x}\|_0 = \sum_{i=1}^n \mathbb{I}\left(x_i \neq 0\right), \text{ where, } \mathbb{I}\left(A\right) = \begin{cases} 1 & \text{A is true.} \\ 0 & \text{A is false.} \end{cases}$$

Is the *zero-norm*, which is often used for quantifying the *sparsity* of a vector, a proper norm?

5. Is the following set of vectors linear independent?

$$\left\{ \begin{bmatrix} 1\\0\\0\\0 \end{bmatrix}, \begin{bmatrix} 1\\2\\0\\0 \end{bmatrix}, \begin{bmatrix} 1\\1\\-1\\1 \end{bmatrix}, \begin{bmatrix} 1\\2\\0\\-1 \end{bmatrix} \right\}$$

What is the span of this set? Does this set form the basis for its span? Does it form an orthonormal basis?

MATRICES 2

1. Conisder the following matrices:

$$\mathbf{A} = \begin{bmatrix} 1 & 1 & -1 & 0 \\ 0 & 2 & -2 & 1 \\ -3 & 1 & 1 & 3 \end{bmatrix} \quad \text{and} \quad \mathbf{B} = \begin{bmatrix} 2 & 1 & 1 \\ 1 & -1 & 1 \\ 3 & 2 & 1 \\ 1 & 2 & 1 \end{bmatrix}$$

Find the product of the two matrices C = AB using the four views of matrix muliplication.

If we change $b_{23} = 0$. Can you compute the new matrix **C** without performing the matrix muliplication?

If we increase the value of the elements of the 3^{rd} column of A by 1, how can we compute the new C without performing the matrix multiplication?

If we insert a new row $\mathbf{1}^{\top}$ in **A** after the $\mathbf{2}^{nd}$ row, how can we compute the new C without performing the matrix multiplication?

- 2. Show that the matrix product ABC can be written as a weighted sum of the outer products of the columns of A and rows of C, with the weights coming from the matrix **B**.
- 3. Prove the following for the matrices $A_1, A_2, A_3, \dots A_n$.

$$(\mathbf{A}_1, \mathbf{A}_2 \mathbf{A}_3 \dots \mathbf{A}_n)^\top = \mathbf{A}_n^\top \mathbf{A}_{n-1}^\top \dots \mathbf{A}_2^\top \mathbf{A}_1^\top$$

- 4. **Nilpotent matrices**. Show that a strictly triangular matrix $\mathbf{A} \in \mathbb{R}^{n \times n}$, $\mathbf{A}^{\mathbf{n}} = \mathbf{0}$.
- 5. Matrix Inversion Lemma. Consider an invertible matrix A. The matrix $\mathbf{A} + \mathbf{u}\mathbf{v}^{\top}$ is invertible if and only if the two vectors $\mathbf{u}, \mathbf{v} \neq \mathbf{o}$, and $\mathbf{v}^{\top} \mathbf{A}^{-1} \mathbf{u} \neq -1$. Then, the inverse is given by,

$$\left(\mathbf{A} + \mathbf{u}\mathbf{v}^{\top}\right)^{-1} = \mathbf{A}^{-1} - \frac{\mathbf{A}^{-1}\mathbf{u}\mathbf{v}^{\top}\mathbf{A}^{-1}}{1 + \mathbf{v}^{\top}\mathbf{A}^{-1}\mathbf{u}}$$

- 6. Prove that $tr(\mathbf{AB}) = tr(\mathbf{BA})$, where $\mathbf{A} \in \mathbb{R}^{n \times d}$ and $\mathbf{B} \in \mathbb{R}^{d \times n}$.
- 7. Effect of matrix operation on matrix rank. Let $\mathbf{A} \in \mathbb{R}^{n \times d}$ and $\mathbf{B} \in$ $\mathbb{R}^{d \times n}$, with ranks a and b respectively. What is the rank of the following matrices?
 - a) A + B
 - b) AB
- 8. Show that the rank (AB) = rank(A), when **B** is square and full rank.
- 9. Let $A, B \in \mathbb{R}^{n \times n}$, AB is non-singular if and only if both A and B are non-singular.
- 10. Let **A** is a full rank matrix. Show that the *Gram matrix* of the column space, $\mathbf{A}^{\top}\mathbf{A}$ is invertible.

ORTHOGONALITY 3

- 1. If **A** is an orthogonal matrix, show that $\mathbf{A}^{-1} = \mathbf{A}^{\top}$.
- 2. If P_S is the orthogonal projection matrix onto the subspace S, then what is the corresponding orthogonal projection matrix onto \mathbb{S}^{\perp} – the orthogonal complement of S?
- 3. Let $x, y \in \mathbb{R}^n$. Let $\{u_1, u_2, \dots u_n\}$ be an orthonormal basis for \mathbb{R}^n . Show that the following holds,

$$\boldsymbol{x}^{\top}\boldsymbol{y} = \sum_{i=1}^{n} \left(\boldsymbol{x}^{\top}\boldsymbol{u}_{i}\right) \cdot \left(\boldsymbol{u}_{i}^{\top}\boldsymbol{y}\right)$$

- 4. Consider the following set of vectors, $S = \{a_1, a_2, a_3, \dots a_n\}$, where $a_i \in$ \mathbb{R}^n . The set S is linearly independent. Find the orthogonal components of a vector $\mathbf{b} \in \mathbb{R}^n$ in the subspace spanned by the sets of vectors $S_1 = {\mathbf{a}_i}_{i=1}^m \text{ and } S_1^{\perp}.$
- 5. Consider the set of $n \times n$ orthogonal matrices,

$$\mathbf{Q} = \left\{ \mathbf{Q} \, \middle| \, \mathbf{Q} \in \mathbb{R}^{n \times n} \text{, } \mathbf{Q}^{\top} \mathbf{Q} = \mathbf{Q} \mathbf{Q}^{\top} = \mathbf{I}_n \right\}$$

Is this set a subspace of $\mathbb{R}^{n \times n}$? Show that the set is closed under matrx multiplication.

- 6. Consider the linear map, y = Ax, such that $x, y \in \mathbb{R}^n$ and $A \in \mathbb{R}^{n \times n}$. Let us assume that A is full rank. What conditions must A satisfy for the following statements to be true,
 - a) $\|y\|_2 = \|x\|_2$, for all **x**, **y** such that **y** = **Ax**.
 - b) $\mathbf{y}_1^\mathsf{T}\mathbf{y}_2 = \mathbf{x}_1^\mathsf{T}\mathbf{x}_2$, for all $\mathbf{x}_1,\mathbf{x}_2,\mathbf{y}_1,\mathbf{y}_2$ such that $\mathbf{y}_1 = \mathbf{A}\mathbf{x}_1$ and $\mathbf{y}_2 =$

Note: A linear map **A** with the aforementioned properties preserves lengths and angle between vectors. Such maps are encountered in rigid body mechanics.

MATRIX INVERSES 4

- 1. Find a left inverse for the matrix $\mathbf{A} = \begin{bmatrix} 1 & 1 \\ -1 & 1 \\ 0 & 1 \end{bmatrix}$. Find the set of all possible left inverses.
- 2. Show that if the product of two square $d \times d$ matrices **A** and **B** is the identity matrix I, then BA = I.
- 3. Consider an upper triangular matrix $\mathbf{R} \in \mathbb{R}^{n \times n}$. We are interested in solving the following set of n linear equations,

$$\mathbf{R}\mathbf{x} = \mathbf{e}_{i}$$

 $\mathbf{x} = \begin{bmatrix} x_1 & x_2 & x_3 & \dots & x_n \end{bmatrix}^{\mathsf{T}}$ is the solution to the above equation. Show that $x_{i+1} = x_{i+2} = \ldots = x_n = 0$.

Show that the solution to this equation is equal to the ith column of the inverse of **R**.

4. Find the pseudo-inverse of the matrix $\mathbf{A} = \begin{bmatrix} 1 & 1 \\ 1 & -1 \\ 1 & 1 \end{bmatrix}$. Show that the matrix AA^{\dagger} is the orthogonal projection matrix onto the column space of A.
